产品概述

LW55 高精度硅陶瓷系列为压阻硅压力传感器，可提供指定满量程压力范围和温度范围读取压力的数字输出。LW55 系列通过使用板载专用集成电路 (ASIC) 针对传感器偏移、灵敏度、温度效应和非线性进行了充分校准和温度补偿。经校准的压力输出值会在 1 kHz 左右更新。LW55 系列在 0°C 到 60°C 的温度范围内进行校准。该传感器可在 3.3Vdc 或 5.0Vdc 的单电源条件下工作。这些传感器测量绝压、差压和表压。绝压型号的传感器具备内部真空参照以及与绝压成比例的输出值。差压型号的传感器允许向感应模片的任意一侧加压。表压型号的传感器以大气压力为参考，提供与大气压力变化成比例的输出值。LW55 压力传感器适用于无腐蚀性、非离子气体 (例如空气和其他干燥气体)。提供的选件可延伸这些传感器的性能，使其适用于无腐蚀性、非离子的液体。所有产品均遵循 ISO 9001 标准设计和制造。

产品特点

- ☐ 多样化的封装：LW55 系列压力传感器为硅压阻精密压力传感器，采用模块化设计，具有双管朝上封装，可满足客户不同安装环境的需要
- ☐ 工作电压较低，能耗极小，供电电压可以为 3.3V 或 5V 输入
- ☐ 业界领先的长期稳定性：通过压力敏感芯片的优选和封装工艺的技术处理，作为微压力传感器与业内其他传感器相比表现出色，具有优异的长期稳定性
- ☐ 内部诊断功能可增强系统的可靠性
- ☐ 还提供了模拟输出选项
- ☐ 绝压、差压和表压类型
- ☐ 达到 0.25% FSS BFSL (满刻度量程最佳直线) 的极高精确度
- ☐ 总误差带为 1% 的满刻度量程最大值
- ☐ 所有这些产品都同样具备业界领先的性能规格
- ☐ 与 I2C 或 SPI 兼容的 14 位数字输出，压力输出 14 位，可以同时监控温度，温度输出 11 位
- ☐ 模拟数字放大输出提供 10% 到 90% 输出或 5% 到 95% 输出
- ☐ 在 0°C 到 60°C 的温度范围内进行精密 ASIC 调节和温度补偿
- ☐ 符合 RoHS 标准
- ☐ 压力口特点：直径 3.175MM 倒钩状压力口可以稳固的和 2.38MM 内径的压力管牢固连接测试压力
- ☐ 客户定制：精度、总偏差和温度补偿范围以及信号输出方式等可根据客户需求定制，非标准产品请联系我们

注释:

- 1、额定值是设备在不损坏的前提下所能承受的最大极限。
- 2、该传感器不受反向极性保护。将错误的引脚与电源连接或者接地可能会导致电气故障。
- 3、补偿温度范围是指传感器可以在特定的性能限制下产生与压力成比例的输出的温度范围。
- 4、工作温度范围是指传感器可以产生与压力成比例的输出的温度范围，但不一定在特定性能限制范围之内。
- 5、精度：相对适用于在 25°C 时的压力范围内所测输出的最佳直线 (BFSL) 的最大输出偏差。包括所有因压力非线性、压力滞后和不重复性造成的误差。
- 6、综合偏差：相对整个补偿温度和压力范围内理想传递函数的最大偏差。包括所有因偏置、满刻度量程、压力非线性、压力滞后、可重复性、偏置热效应、量程热效应和热滞后造成的误差。
- 7、满刻度量程 (FSS) 是指在压力范围最大限制值 (Pmax.) 和最小限制值 (Pmin.) 处测得的输出信号之间的代数差。
- 8、寿命可能因传感器使用的特定应用而有所变化。
- 9、过压：可安全施加到产品的最大压力，使产品在压力返回到工作压力范围时规格保持不变。施加过高的压力可能会对产品造成永久损坏。除非另有规定，否则这适用于工作温度范围内任何温度下的所有可用压力口。
- 10、爆破压力：可施加到产品的任意压力口而不造成压力媒介脱离的最大压力。在经受任何超过爆破压力的压力之后，产品将不能正常工作。
- 11、客户定制请联系零壹智控业务人员。

注意:

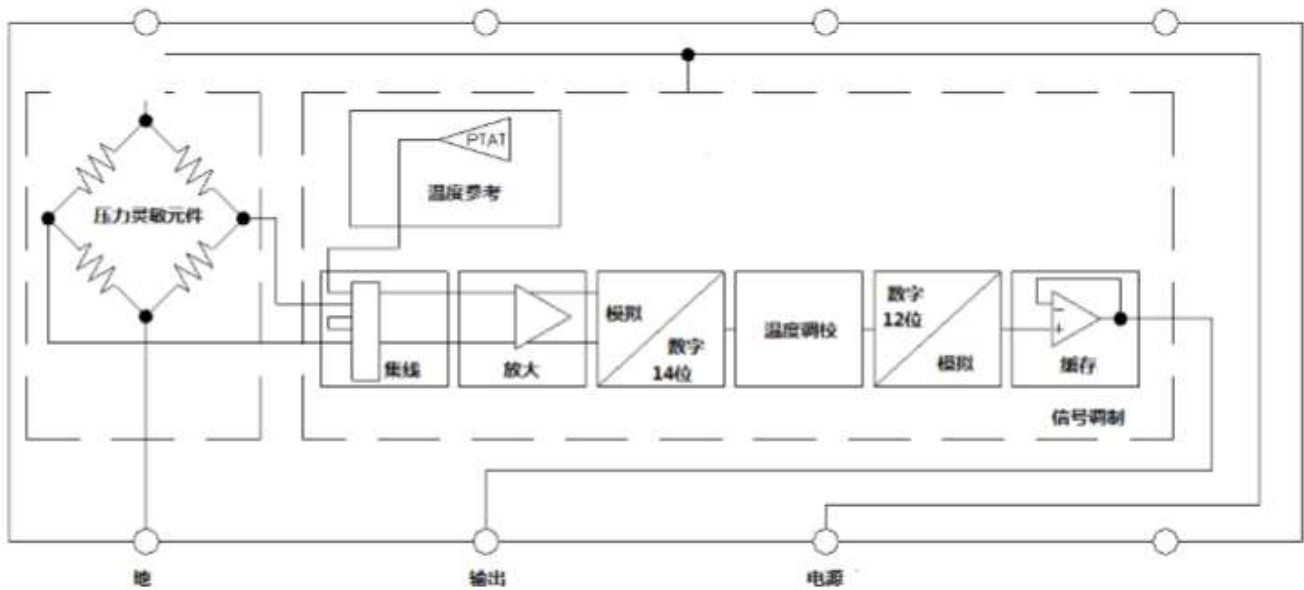

产品损坏

- 确保液体介质仅用于压力口 A；压力口 B 与液体不相容。
- 确保液体介质不含颗粒。所有 LW55 传感器均为终端密封设备，颗粒会在传感器内积聚，造成设备损坏或影响传感器输出。
- 建议将传感器的压力口 A 朝下放置，这样系统中的颗粒就不容易进入并停留在压力传感器内。
- 确保液体介质在干燥时不会产生残留物。传感器内的堆积物可能会影响传感器输出。清洗终端密封的传感器十分困难，而且无法有效地去除残留物。
- 确保液体介质与接液材料相容。不相容的液体介质只会降低传感器的性能，并可能导致传感器故障。
- 不遵循这些说明可能会导致产品损坏。

I2C AND SPI COMMUNICATION SPECIFICATIONS

1. I2C Interface Specification

LW55 series is optimized in terms of sensor readout and power consumption when the factory setting for I2C. For detailed specifications of the I2C protocol, see The I2C Bus Specification.

1.1 Interface Connection-External

Bi-directional bus lines are implemented by the devices (master and slave) using open-drain output stages and a pull-up resistor connected to the positive supply voltage. The recommended pull-up resistor value depends on the system setup (capacitance of the circuit or cable and bus clock frequency). In most cases, 4.7kΩ is a reasonable choice. The capacitive loads on SDA and SCL line have to be the same. It is important to avoid asymmetric capacitive loads.

I²C Transmission start Condition

Both bus lines, SDA and SCL, are bi-directional and therefore require an external pull-up resistor.

1.2 I2C Address

The I2C address consists of a 7-digit binary value. The factory setting for I2C slave address is 0x28, 0x36 or 0x46 depending on the interface type selected from the ordering information. The address is always followed by a write bit (0) or read bit (1). The default hexadecimal I2C header for read access to the sensor is therefore 0x51, 0x6D, 0x8D respectively, based on the ordering information.

1.3 INT/SS pin

When programmed as an I2C device, the INT/SS pin operates as an interrupt. The INT/SS pin rises when new output data is ready and falls when the next I2C communication occurs.

1.4 Transfer sequences

Transmission START Condition (S): The START condition is a unique situation on the bus created by the master, indicating to the slaves the beginning of a transmission sequence (the bus is considered busy after a START).

I²C Transmission start Condition

A HIGH to LOW transition on the SDA line while SCL is HIGH

Transmission STOP Condition (P): The STOP condition is a unique situation on the bus created by the master, indicating to the slaves the end of a transmission sequence (the bus is considered free after a STOP).

I²C Transmission stop Condition

A LOW to HIGH transition on the SDA line while SCL is HIGH

Acknowledge (ACK) / Not Acknowledge (NACK): Each byte (8 bits) transmitted over the I²C bus is followed by an acknowledge condition from the receiver. This means that after the master pulls SCL low to complete the transmission of the 8th bit, SDA will be pulled low by the receiver during the 9th bit time. If after transmission of the 8th bit the receiver does not pull the SDA line low, this is considered to be a NACK condition.

If an ACK is missing during a slave to master transmission, the slave aborts the transmission and goes into idle mode.

I²C Acknowledge / Not acknowledge

Each byte is followed by an acknowledge or a not acknowledge, generated by the receiver

1.5 Data Transfer Format

Data is transferred in byte packets in the I2C protocol, which means in 8-bit frames. Each byte is followed by an acknowledge bit. Data is transferred with the most significant bit (MSB) first.

A data transfer sequence is initiated by the master generating the Start condition (S) and sending a header byte. The I2C header consists of the 7-bit I2C device address and the data direction bit (R/_W).

The value of the R/_W bit in the header determines the data direction for the rest of the data transfer sequence. If R/_W = 0 (WRITE) the direction remains master-to-slave, while if R/_W = 1 (READ) the direction changes to slave-to-master after the header byte.

1.6 Command Set and data Transfer Sequences

The I2C master command starts with the 7bit slave address with the 8th bit =1 (READ).The sensor as the slave sends an acknowledge (ACK) indicating success. The sensor has four I2C read commands: Read_MR, Read_DF2, Read_DF3, and Read_DF4. Figure 1.6 shows the structure of the measurement packet for three of the four I2C read commands, which are explained in sections 1.6.1 and 1.6.2

Figure 1.6 – I2C Measurement Packet Reads

I2CRead_DF (Data Fetch)

For Data Fetch commands, the number of data bytes returned by the RBiCiLite™ is determined by when the master sends the NACK and stop condition. For the Read_DF3 data fetch command (Data Fetch 3 Bytes; see example 3 in Figure 1.6), the sensor returns three bytes in response to the master sending the slave address and the READ bit (1): two bytes of bridge data with the two status bits as the MSBs and then 1 byte of temperature data (8-bit accuracy). After receiving the required number of data bytes, the master sends the NACK and stop condition to terminate the read operation. For the Read_DF4 command, the master delays sending the NACK and continues reading an additional final byte to acquire the full corrected 11-bit temperature measurement. In this case, the last 5 bits of the final byte of the packet are undetermined and should be masked off in the application. The Read_DF2 command is used if corrected temperature is not required. The master terminates the READ operation after the two bytes of bridge data (see example 2 in Figure 1.6).

The two status bits (Bit 15 and Bit 14) give an indication of stale or valid data depending on their value. A returned value of 00 indicate "normal operation and a good data packet" while a returned value of 10 indicates "stale data that has been already fetched". Users that use "status bit" polling should select a frequency slower than 20% more than the response time.

2. SPI interface Specification

The SPI interface of sensor can be programmed for falling-edge MISO change.

2.1 SPI Read_DF (Data Fetch)

For simplifying explanations and illustrations, only falling edge SPI polarity will be discussed in the following sections. The SPI interface will have data change after the falling edge of SCLK. The master should sample MISO on the rise of SCLK. The entire output packet is 4 bytes (32 bits). The high bridge data byte comes first, followed by the low bridge data byte. Then 11 bits of corrected temperature (T[10:0]) are sent: first the T[10:3] byte and then the {T[2:0],xxxxx} byte. The last 5 bits of the final byte are undetermined and should be masked off in the application. If the user only requires the corrected bridge value, the read can be terminated after the 2nd byte. If the corrected temperature is also required but only at an 8-bit resolution, the read can be terminated after the 3rd byte is read.

Packet = [{S(1:0),B(13:8)}, {B(7:0)}, {T(10:3)}, {T(2:0),xxxxx}] Where
 S(1:0) = Status bits of packet (normal, command, busy, diagnostic)
 B(13:8) = Upper 6 bits of 14-bit bridge data.
 B(7:0) = Lower 8 bits of 14-bit bridge data.
 T(10:3) = Corrected temperature data (if application does not require corrected temperature, terminate read early)
 T(2:0),xxxxx = Remaining bits of corrected temperature data for full 11-bit resolution
 HIZ = High impedance

C code example for I2C with Read_DF4 command

On power-up, PORTB is initialized to all inputs with the internal pull-ups turned off, the external pull-ups pull the SDA and SCL lines high and the PORTB output latch bits SCL and SDA are initialized to zero. Routines WriteSDA and WriteSCL toggle their respective data direction bit depending on the value of parameter "state". When state is a "1" the port pin is configured as input (external pull-ups pull high). When state is a "0" the port pin is configured as an output and the latch drives the pin low. WriteSDA and WriteSCL are very simple routines that could be incorporated into their respective calling routines to further reduce the code size.

General Calling Sequence for the Routines
